Supplement of

Ozone vegetation damage effects on gross primary productivity in the United States

Fig. S1. Distribution of 40 North American Carbon Program (NACP) sites. The color indicates different land types as evergreen needleleaf forest (ENF, blue), deciduous broadleaf forest (DBF, magenta), grasslands (GRA, green), croplands (CRO, red), shrublands (SHR, yellow). “Mixed Forests” are classified as ENF, “Permanent Wetlands” and “Woody Savannas” as SHR (Table S1). The local vegetation type at each site is described in appendix Table A.
Fig. S2. Land cover types in North America developed by the International Satellite Land-Surface Climatology Project (ISLSCP).
Fig. S3. Comparison of monthly mean leaf area index (LAI, m² m⁻²) from the Modern Era-Retrospective Analysis (MERRA) reanalysis (red solid lines) and the Moderate Resolution Imaging Spectroradiometer (MODIS) (blue dashed lines) at each NACP site. The name and location (longitude, latitude) are shown in the title. The land types include evergreen needleleaf forest (ENF), deciduous broadleaf forest (DBF), shrublands (SHR), grasslands (GRA), and croplands (CRO).
Fig. S4. Comparison of long-term monthly mean GPP (g [C] m⁻² day⁻¹) from observations (blue points with error bars indicating one standard deviation) and the O₃-free simulations (black lines with shadings indicating one standard deviation) averaged over measurement period at each site. The simulation, METsite_LAImerra, is driven with meteorological forcings from MERRA and site measurements. The LAI is from MERRA. The name and location (longitude, latitude) are shown in the title. The land types include evergreen needleleaf forest (ENF), deciduous broadleaf forest (DBF), shrublands (SHR), grasslands (GRA), and croplands (CRO).
Fig. S5. Comparison of simulated summer average GPP without O₃ damage (blue) and with O₃ damage (red) with observations at 40 NACP sites.
Fig. S6. The calculated (a) $\chi^2$ of GPP and changes in $\chi^2$ after the inclusion of O$_3$ damage impact with (b) low and (c) high O$_3$ sensitivity at each site. The sites are sorted according to the values of $\chi^2$ in (a). The land cover definitions are: GRA, Grasslands; CRO, Croplands; ENF, Evergreen Needleleaf Forest; DBF, Deciduous Broadleaf Forest; SHR, Shrubland. See section 2.2.1 for the definition of $\chi^2$. 
Fig. S7. Comparison of summertime surface (a, b) diurnal mean and (c, d) daily maximum 8-hour average ozone between (a, c) GCM and observations from (b) CASTNET and (d) AIRDATA.
Fig. S8. Comparison of summertime GPP from (a) simulations with high ozone damage effects and (b) in situ measurements from NACP.
