## 1 2D Profiles of Yield in the Global Simulation

The panels of Fig. S1 show the zonal mean of the effective and direct yield as an annual and seasonal climatology. Overall, the vertical profile in the tropics generally applies to the mid latitudes as well. The area below the tropopause, where the yield peaks in values above 2, is also represented at higher latitudes, where the tropopause is lower than in the tropics. A notable exception is that in the summer hemisphere the yield below the tropopause is smaller and in the upper stratosphere larger than in the tropics. It is, however, not possible to apply the presented method to calculate yield of water vapour ( $H_2O$ ) from the oxidation of methane ( $CH_4$ ) ( $\gamma_{H_2O}$ ) in the winter polar region, since through the absence of sunlight the concentrations of hydroxyl radical (OH) are very low and therefore the loss of  $CH_4$  so small that numerical errors influence the calculation of  $\gamma_{H_2O}$  too much for a reliable estimate.

**Figure S1.** Zonal mean of effective (upper panels) and direct yield (lower panels) from global model as an annual climatology (left column), seasonal climatology of the months June, July and August (middle column) and of the months December, January and February (right column) respectively.

## 2 2D Profiles of the Ratio of H:H<sub>2</sub>:H<sub>2</sub>O

Considering the zonal mean of the H portions (see Fig. S2), it becomes again apparent that the tropical profile of the H portion is a good estimate for its annual climatology. The local minimum at the tropopause is, for example, evident throughout the year. In the summer hemispheres the hydrogen content in H<sub>2</sub>O increases in the upper stratosphere and mesosphere, while it decreases substantially at the same altitudes in the winter hemisphere. Where the share of H portion of H<sub>2</sub>O is low the share of hydrogen gas (H<sub>2</sub>) increases. For polar stratospheric clouds variations in the ratio of H<sub>2</sub>O to H<sub>2</sub> are decisive. An investigation of this influence is, however, beyond the scope of this study.

**Figure S2.** Zonal mean of un-tagged (upper panels) and tagged (lower panels) H portion in H<sub>2</sub>O with respect to the un-tagged and tagged hydrogen content ( $H+2\times H_2+2\times H_2O$ ) as annual climatology (left column), seasonal climatology of the months June, July and August (middle column) and of the months December, January and February (right column) respectively.

### 3 Results of the Box Model Simulations
