

(a) OFR254-7, medium RO₂+RO₂

(b) OFR254-7, fast RO₂+RO₂

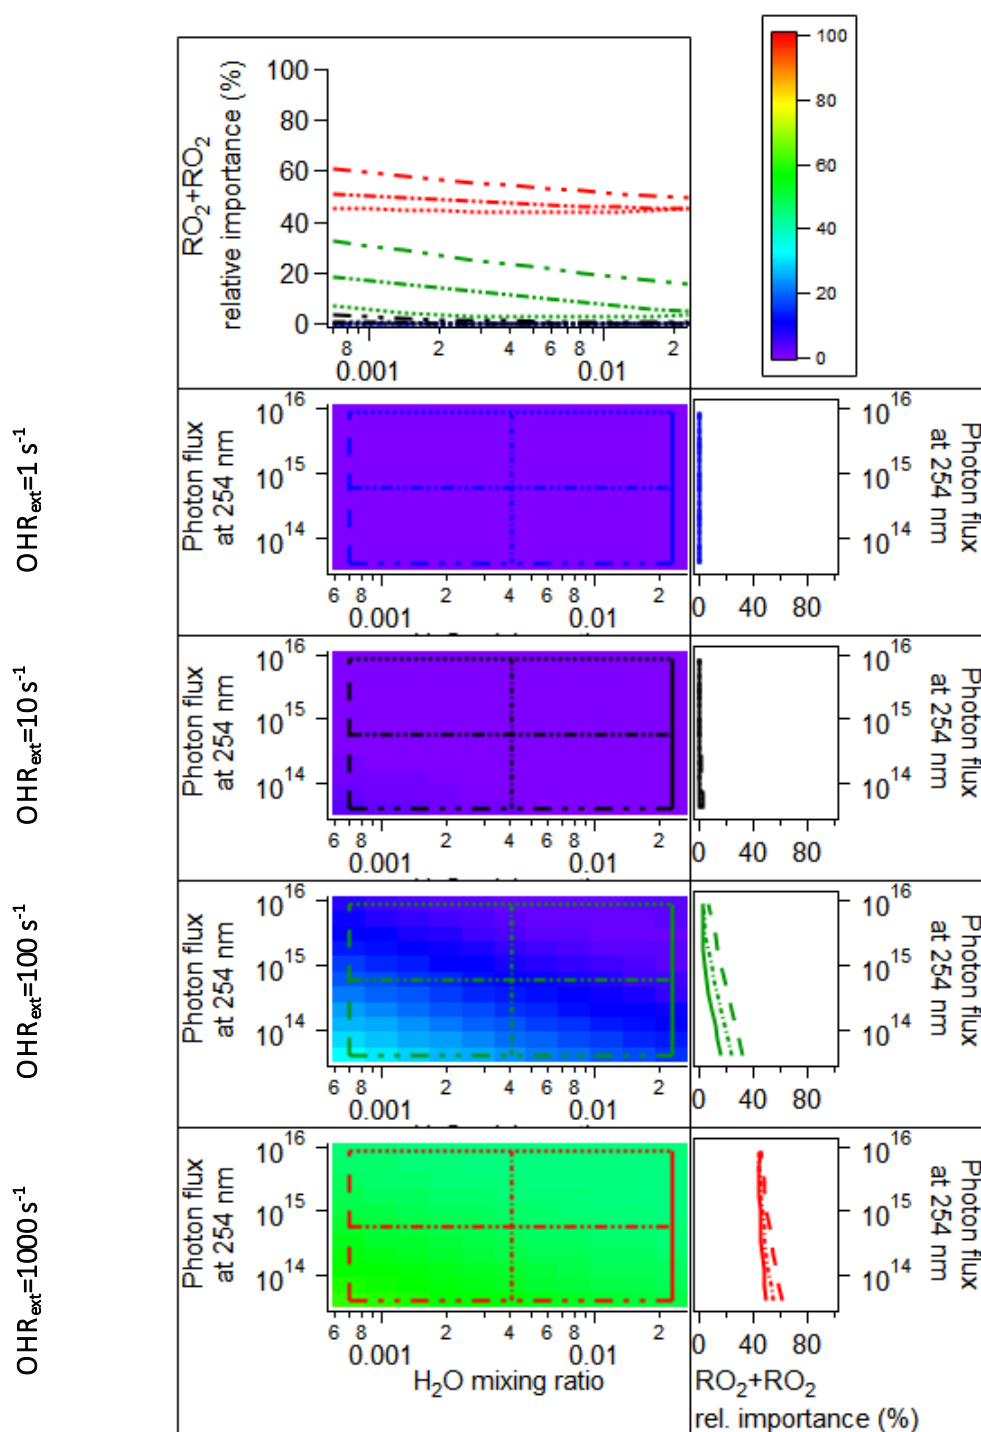

(c) OFR185, very fast $\text{RO}_2 + \text{RO}_2$

(d) OFR254-70, very fast $\text{RO}_2 + \text{RO}_2$

Figure S1. Same format as Fig. 1, but for (a) medium and (b) fast $\text{RO}_2 + \text{RO}_2$ in OFR254-7 (including OFR254-7-iN₂O) and very fast $\text{RO}_2 + \text{RO}_2$ in (c) OFR185 (including OFR185-iN₂O) and (d) OFR254-70 (including OFR254-70-iN₂O).

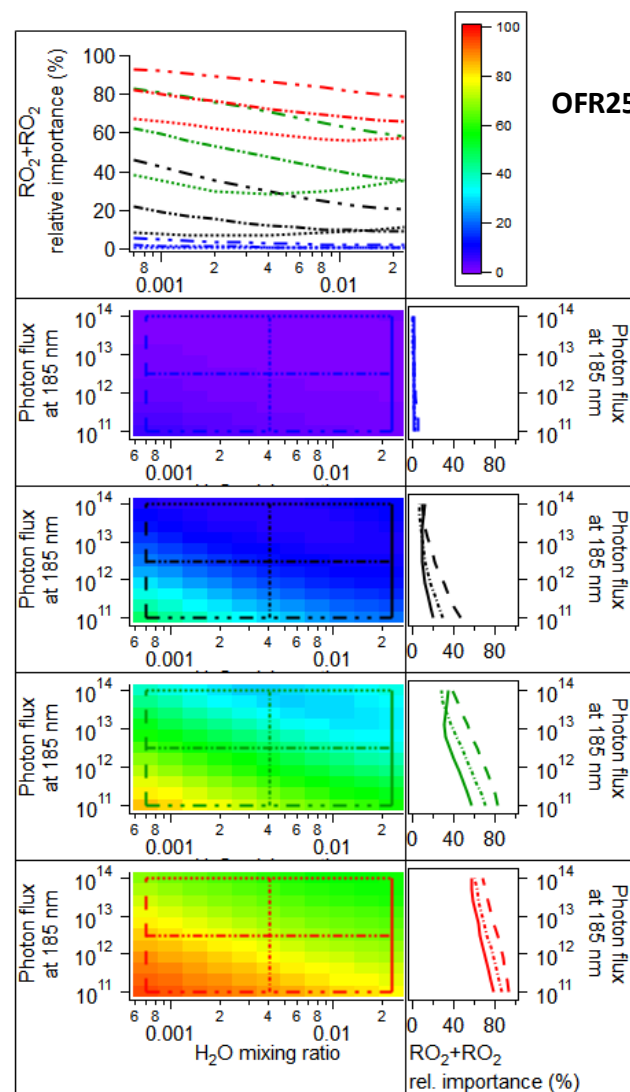

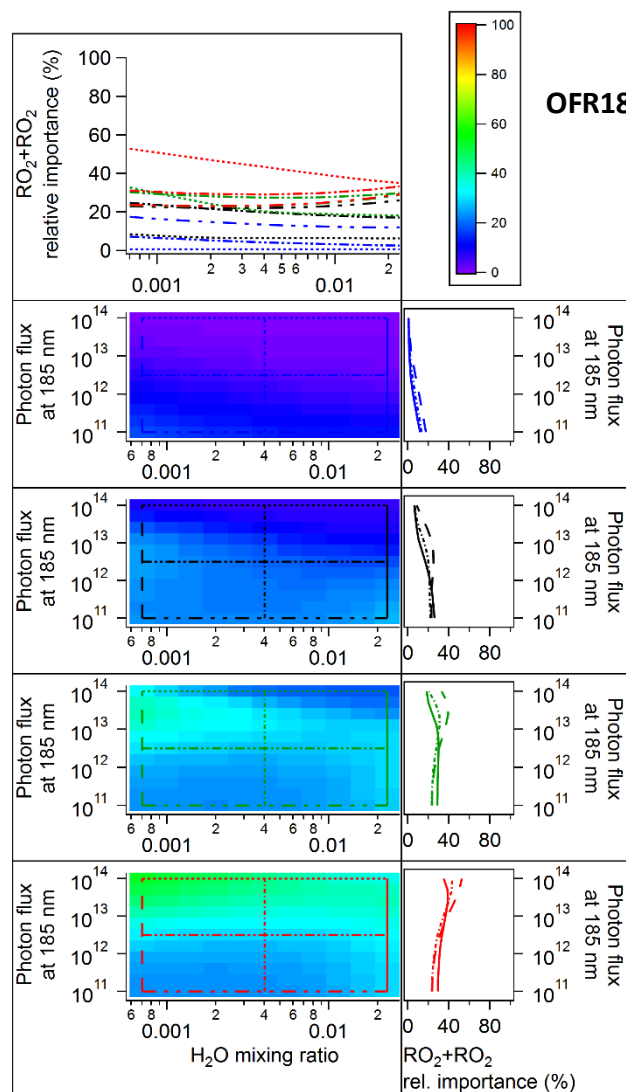

27

28 **Figure S2.** Dependence of the relative importance of RO_2+RO_2 in the fate of RO_2 (with the medium
 29 self/cross reaction rate constant and without RO_2+OH and RO_2 isomerization considered) on H_2O and UV,
 30 for OHR_{ext} of 1, 10, 100, and 1000 s^{-1} (first, second, third, and fourth row of image plots in each multi-
 31 panel composite, respectively) in OFR254-70 ($\text{N}_2\text{O}=0$). The panels above and on the right of image plots
 32 are the line plots of the RO_2+RO_2 relative importance in several typical cases. These cases are denoted in
 33 the image plots by horizontal or vertical lines of the same color and pattern as in the line plots. The cut
 34 lines are in blue, black, dark green, and red in the plots for the cases at different external OH reactivity
 35 (excluding NO_y) levels.

36

$\text{OHR}_{\text{ext}}=1000 \text{ s}^{-1}$ $\text{OHR}_{\text{ext}}=100 \text{ s}^{-1}$ $\text{OHR}_{\text{ext}}=10 \text{ s}^{-1}$ $\text{OHR}_{\text{ext}}=1 \text{ s}^{-1}$

37 **Figure S3.** Same format as Fig. S2, but for RO₂ with the fast self/cross reaction rate constants in OFR185 and OFR254-70 (N₂O=0).
38

Figure S4. Average relative importance of RO_2+RO_2 in RO_2 fate (with fast self-/cross-reaction rate constant and without RO_2+OH and RO_2 isomerization considered) for OFR185 (including OFR185- iN_2O) and OFR254-70 (including OFR254-70- iN_2O) high-/low-NO conditions as a function of HO_x recycling ratio (β , see Section 2.3 for its definition) in a sensitivity study with a fixed β for each of the sensitivity cases.

45

46

47

48

(b) OFR185 ($\beta=2$)

49
50

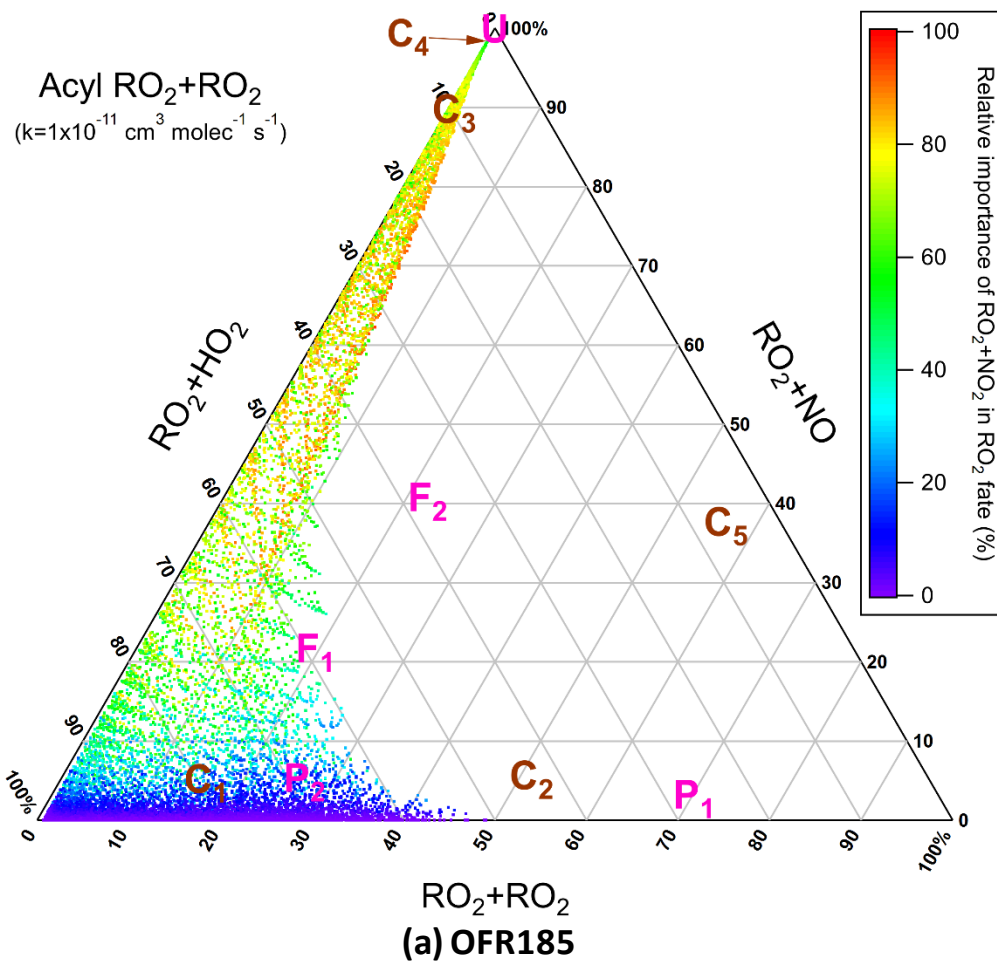

51
52

(d) OFR254-70 ($\beta=2$)

Figure S5. Same format as Fig. 1, but for sensitivity cases with fixed HO_x recycling ratio (β).

57
58

Figure S6. Same format as Fig. 1, but for acyl RO₂ (without RO₂+OH and RO₂ isomerization considered) in OFR185 (including OFR185-iN₂O), OFR254-70 (including OFR254-70-iN₂O). Note that the triangle plots in this figure only show the relative contributions of RO₂+HO₂, RO₂+NO and RO₂+RO₂ to their sum, not to the total loss of acyl RO₂.

66

67 **Figure S7.** Frequency occurrence distributions of NO-to-NO₂ ratios for OFR185-iN₂O and OFR254-70-
 68 iN₂O model cases and measured at the Los Angeles, Pittsburgh and Barcelona ground sites during the
 69 CalNex-LA 2010, PAQS 2002 and DAURE 2009 campaigns, respectively (Zhang et al., 2005; Reche et al.,
 70 2011; Ryerson et al., 2013) and at a ground site in Beijing in both summer and winter (Hu et al., 2016).
 71 OFR cases under bad conditions are filtered out. The total areas of all distributions are identical.

72

73

74 **Figure S8.** (a) RO₂ concentration and composition [primary (1ry), secondary (2ry), tertiary (3ry) and acyl
75 RO₂] as a function of aging time for the simulation of a parcel of air advected from Mexico City during
76 the MILAGRO 2006 campaign using the fully explicit GECKO-A model (Lee-Taylor et al., 2015). (b) The
77 same for a GECKO-A simulation of air in a Rocky Mountain pine forest for the average diurnal cycle
78 during the BEACHON-RoMBAS 2011 campaign (Palm et al., 2016; Hunter et al., 2017). Nighttime is
79 denoted by shaded area.

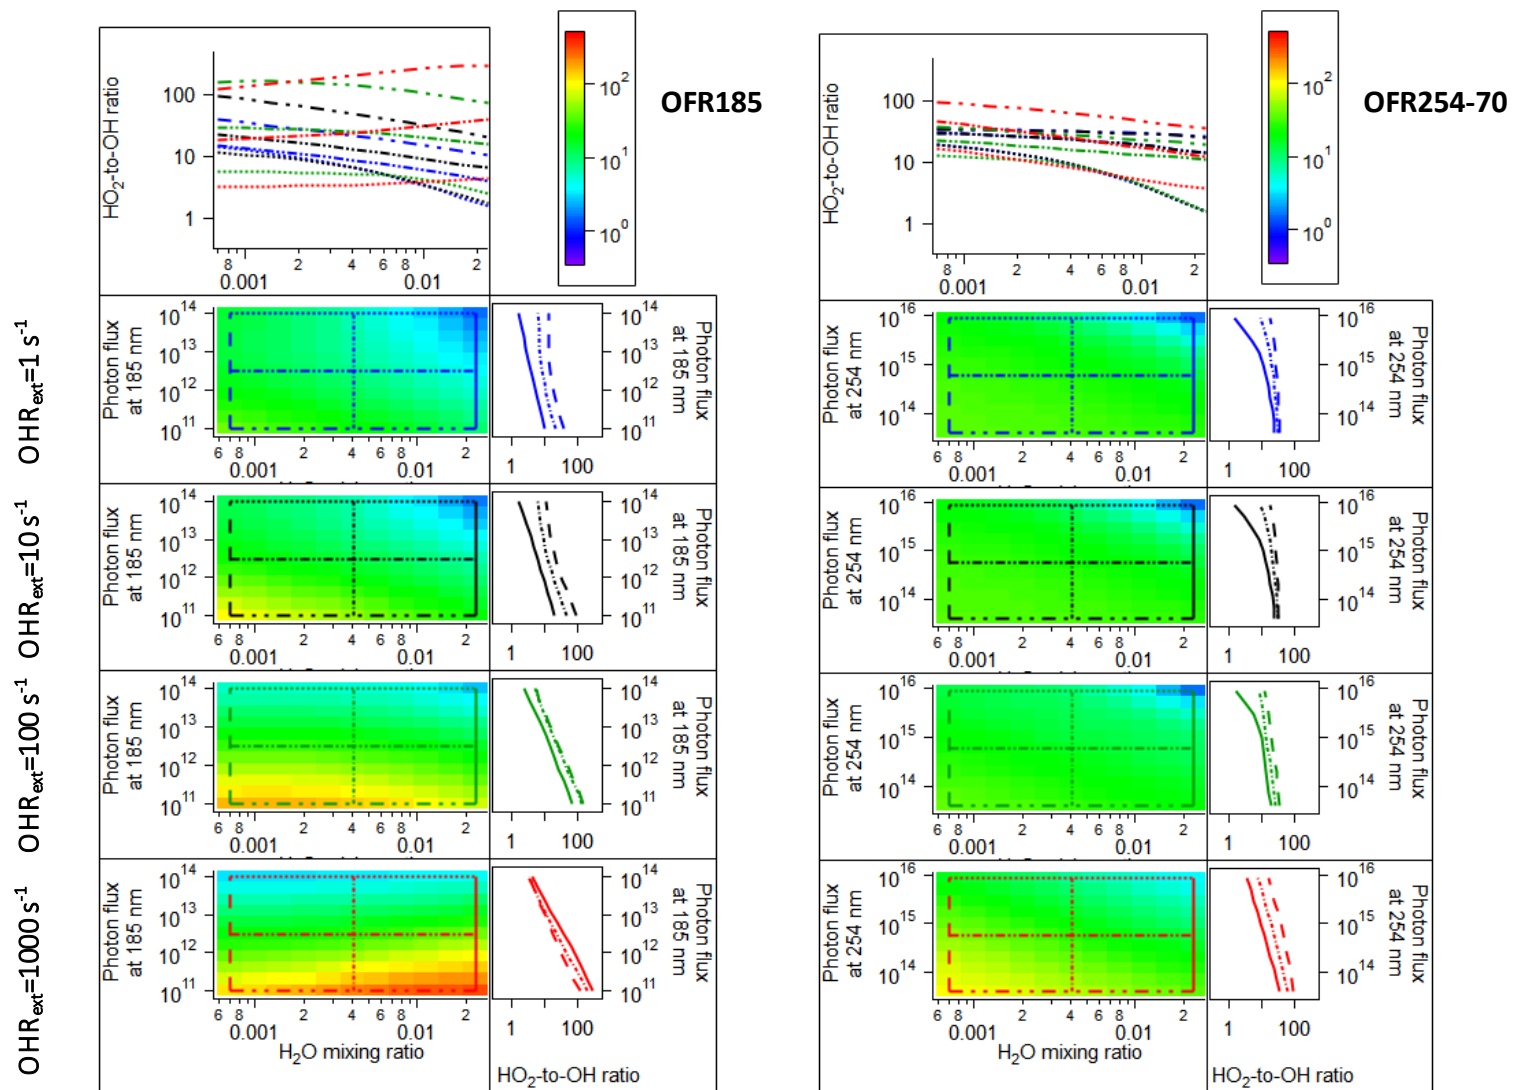

Figure S9. Same format as Fig. S3, but for the HO_2 -to-OH ratio in OFR185 and OFR254-70 ($\text{N}_2\text{O}=0$) cases with medium RO_2 self/cross reaction rate constant.

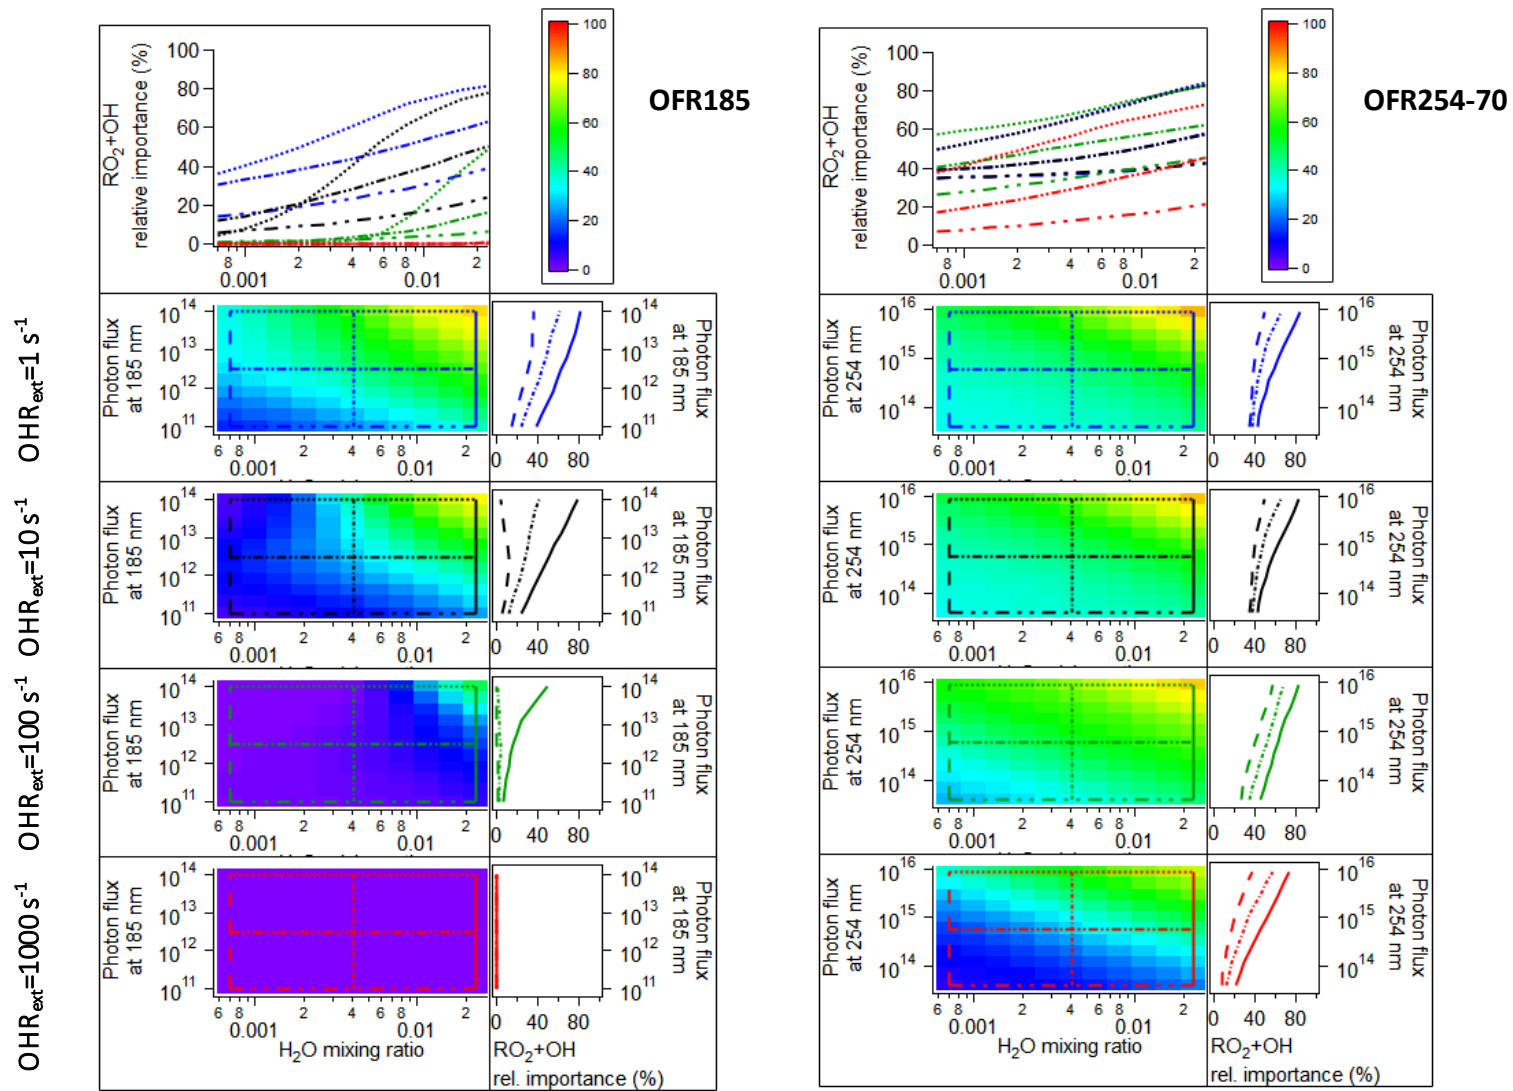

Figure S10. Same format as Fig. S3, but for the relative importance of RO₂+OH in the fate of RO₂ (with medium RO₂ self/cross reaction rate constant) in OFR185 and OFR254-70 (N₂O=0).

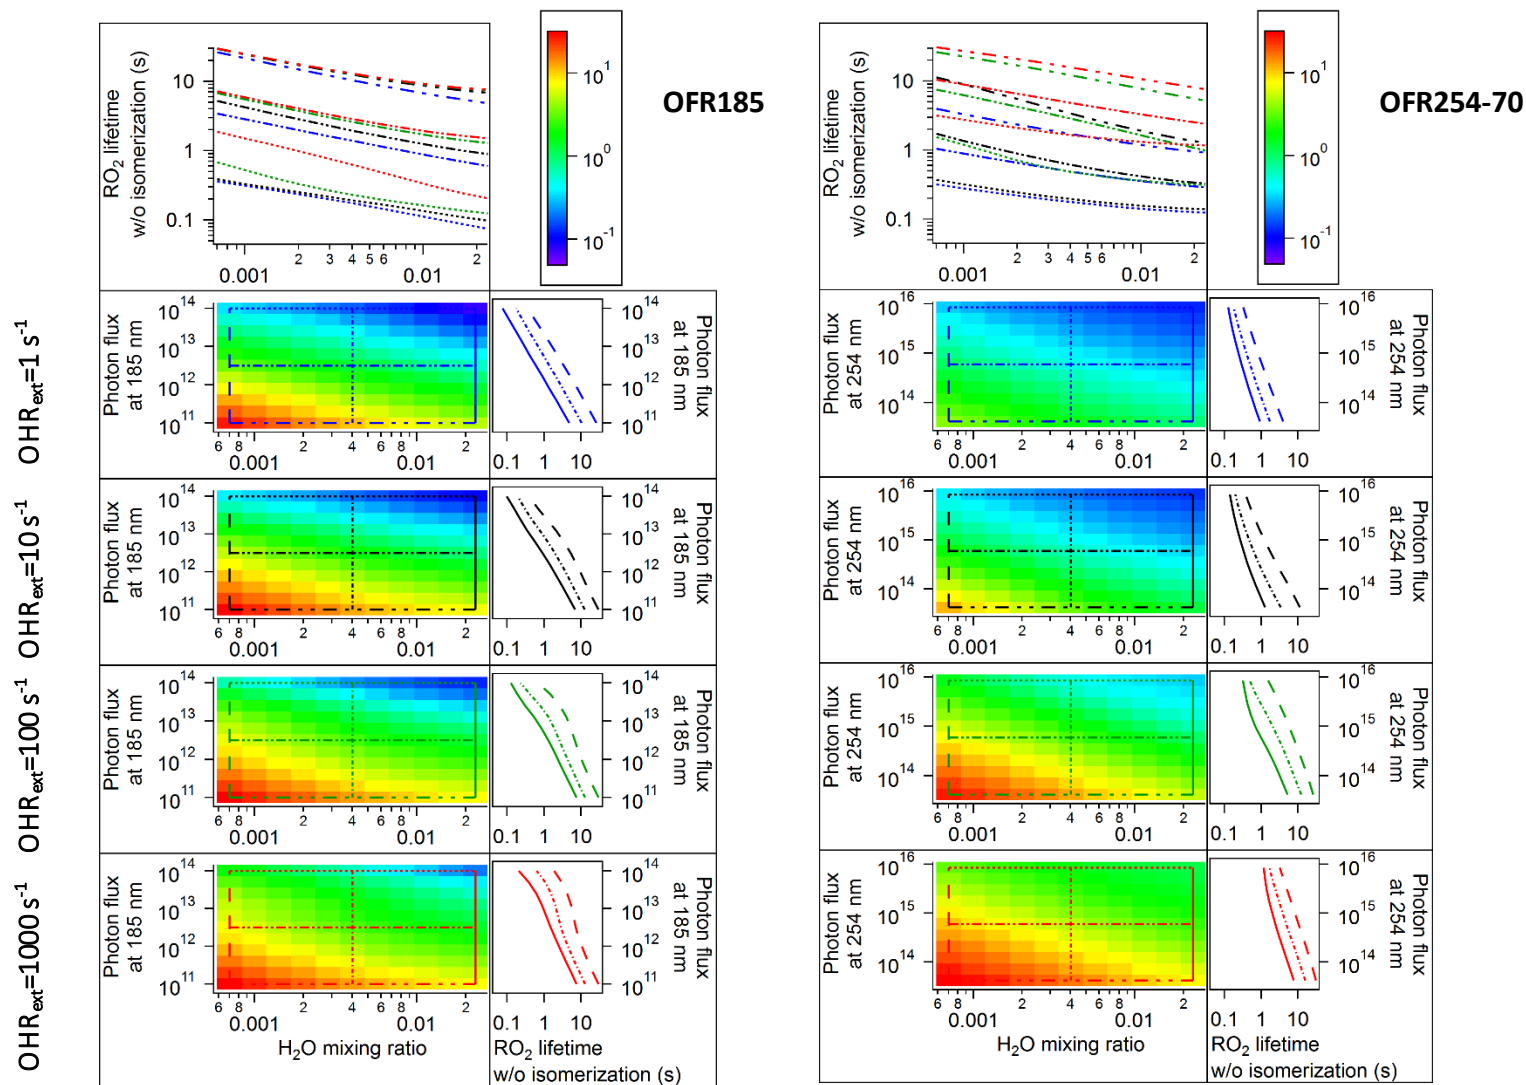

Figure S11. Same format as Fig. S3, but for the RO₂ lifetime [with medium RO₂ self/cross reaction rate constant and excluding the contribution of RO₂ isomerization to its lifetime (but RO₂ isomerization included in the model)] in OFR185 and OFR254-70 (N₂O=0).

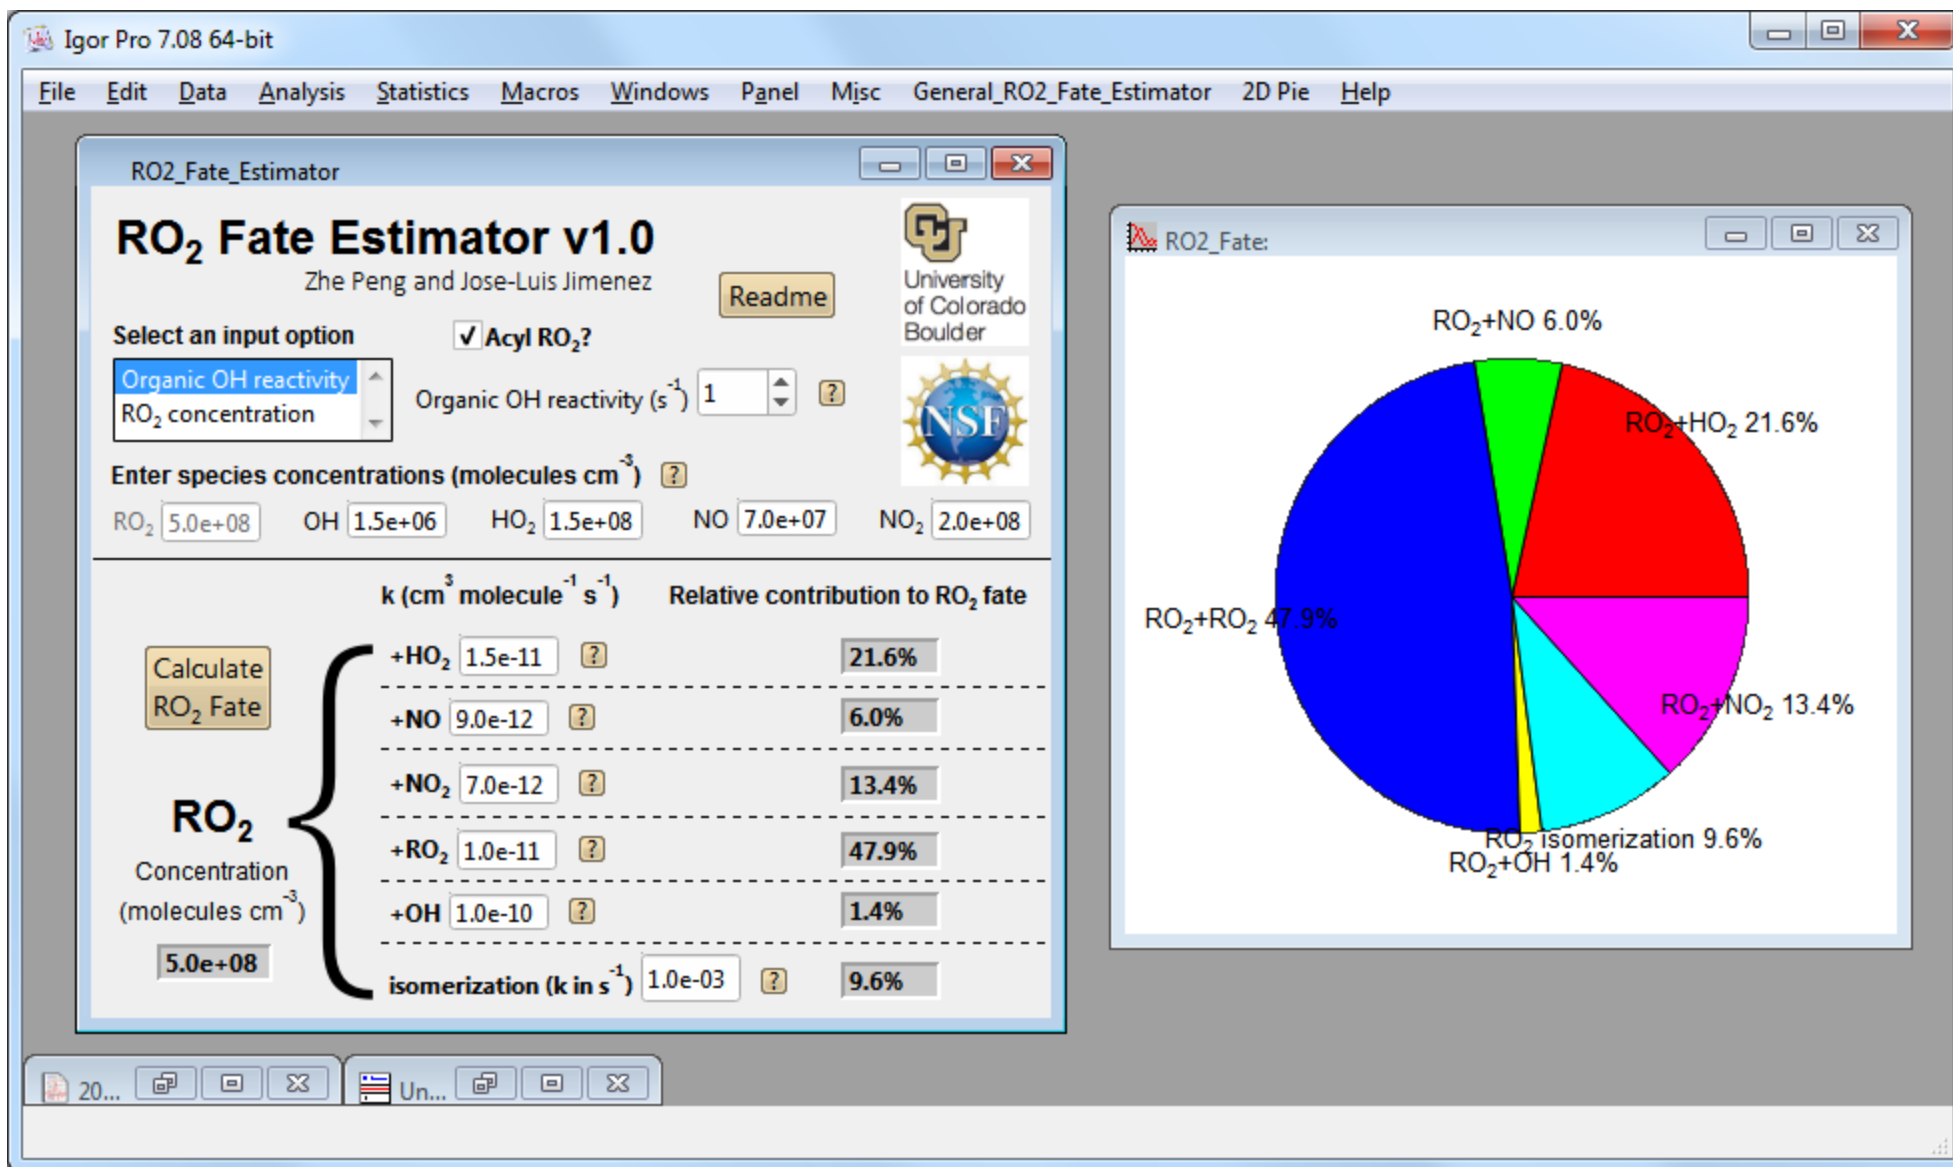

Figure S7. Screenshot of the layout of the General RO₂ Fate Estimator. The Estimator is running in Igor Pro v7 (WaveMetrics, Inc., Lake Oswego, Oregon, USA), which is downloadable at <https://www.wavemetrics.com/software/igor-pro-708-installer>.

Table S1. Definition of OFR condition types in this study (good/risky/bad high/low-NO). Good/risky/bad conditions are classified only in terms of non-tropospheric organic photolysis and this classification does *not* indicate whether RO₂ chemistry is atmospherically relevant.

Condition	Good	Risky	Bad
Criterion	F185 _{exp} /OH _{exp} <3x10 ³ cm s ⁻¹ and F254 _{exp} /OH _{exp} <4x10 ⁵ cm s ⁻¹	F185 _{exp} /OH _{exp} <1x10 ⁵ cm s ⁻¹ and F254 _{exp} /OH _{exp} <1x10 ⁷ cm s ⁻¹ (excluding good conditions)	F185 _{exp} /OH _{exp} ≥1x10 ⁵ cm s ⁻¹ or F254 _{exp} /OH _{exp} ≥1x10 ⁷ cm s ⁻¹
Condition	High-NO	Low-NO	
Criterion	$\frac{r(\text{RO}_2+\text{NO})}{r(\text{RO}_2+\text{HO}_2)} > 1$	$\frac{r(\text{RO}_2+\text{NO})}{r(\text{RO}_2+\text{HO}_2)} \leq 1$
